Some Physical and Social Aspects of Hurricane Research: Hurricane activity and Hurricane Evacuations

This talk, given by a researcher whose research falls at the intersection of geography and climatology, focuses on both some physical and social aspects of her research. First Dr. Collins will present on what factors influence hurricane frequency and why some seasons are more active than others. Then Dr. Collins will discuss her research on hurricane evacuation, specifically focusing on how people’s social connections affect their decision to evacuate or not. Hurricanes Irma and Matthew will be discussed as case studies.

Jennifer Collins
Professor, School of Geosciences
University of South Florida
